

Bioject's new **ZetaJet™** system is the latest advance in needle-free delivery systems, offering a significant array of unique product features and patient benefits that can provide highly competitive differentiation to a wide variety of injectable market segments.

ZetaJet™

The **ZetaJet™** Needle-free Injection System is a compact, spring-powered, durable device. It is intended to deliver vaccines and injectable medications either subcutaneously or intramuscularly.

The **ZetaJet™** is indicated for both professional use and home use for patients who self-inject.

The auto-disable feature eliminates the risks of re-use of a syringe and prevents possible contamination of syringes and vials.

ZetaJet™ Syringe

Studies show a strong preference for a Bioject system versus traditional injection delivery.

ADVANTAGES

- All three injection depths (SC, IM, ID*)
- Custom molded exterior, provides a multitude of ergonomic options, to achieve specific attributes for different clinical or branding applications
- Injection volumes range from 0.05 mL to 0.5 mL
- Eliminates needle-phobia thereby enhancing patient experience
- Leverages Bioject's unique, patented pressure profile
- Indicated for both professional and patient self-injection
- Polycarbonate syringe provides exceptional strength, clarity and heat resistance
- Reliable stainless steel inner core enhances durability in rough environments

*Investigational use only

CONVENIENCE

- Easier to train and use needle-free systems
- Delivers injection in a fraction of a second
- Reduces sharps waste
- The plunger is pre-assembled into the syringe and can be used for reconstitution and other pre-injection tasks

SAFETY

- No risk of needle-stick injury
- Elimination of cross-contamination
- Auto-disabling syringe
